STAND INITIATION	Up to 95,000 acres					
ADAPTIVE MANAGEMENT TREATMENT OPTION	STAND CONDITIONS	CURRENT MORTALITY UP TO 50-100%	% OVERSTORY REMOVAL UP TO 100%	CURRENT	INSECT DISEASE LEVEL MODERAT	TE TO HIGH
		DESCRIPTION			EXAMPLE	
Clearcut	This treatment can remove all the trees from the stand producing a fully exposed microclimate for the development of a new age class.					
Coppice	This treatment removes all of the trees (aspen) from the stand and the majority of the regeneration that occurs is from sprouts or root suckering .					
Stand Replacing Prescribed Fire	This treatment kills all or most of the living canopy (in a forest or woodland, trees) producing a full exposed microclimate and initiates succession or regrowth					
Final Shelterwood Removal	This treatment is a final removal cut that releases established regeneration from the competition with the overwood after there is no longer a need for shelter under the shelterwood regeneration method.		Uncut stand Preparatory cut Establishment cut Apparathly to the standard of	Unmanaged stand (or natural shelterwood)	Removal cut	
Seed Tree Cut (Preparatory)	This treatment removes trees to enhance conditions for seed production and/or develop windfirmness for a future seed-tree seed cut.					
Overstory Removal	This treatment removes trees constituting an upper canopy layer to release understory trees. The primary source of regeneration is advance reproduction.				52510 to 452 to W100, 180481	
Two-aged Clearcut	This treatment is a two –aged regeneration harvest that removes sufficient trees to produce an exposed microclimate for the development of a new age class.					
Two-aged Coppice Cut	A treatment for aspen stands that removes the majority of trees from a stand, leaving at least 10%, and the majority of the regeneration that occurs is from sprouting or root suckering.
